Business Storytelling with Data – Sales Insights, Business Interpretation, and Recommendations

1. Introduction

Business storytelling with data involves analysing business information, identifying meaningful patterns and converting data into actionable business recommendations.

In this exercise, the Sales Performance Dashboard developed using Microsoft Power BI was analysed to identify important sales trends, category performance, city-wise revenue contributions, estimated profitability and customer purchasing behaviour.

2. Objective

The main objectives of this exercise are:

- Analyse sales performance using Power BI dashboard visualizations.
- Identify meaningful business insights from KPIs and charts.
- Understand city-wise and category-wise sales performance.
- Analyse monthly sales trends and estimated profitability.
- Interpret business findings and provide actionable recommendations.

3. Dataset Description

The existing Sales dataset containing 100 transactions was used for this analysis.

The dataset includes the following fields:

- Order ID
- Date
- Customer ID
- Category
- Product
- City
- Quantity
- Unit Price
- Sales Amount

An additional Estimated Profit column was created using assumed category-wise profit margins to practise profitability analysis.

Note: Estimated profit is based on illustrative assumptions and does not represent actual business profit.

4. Dashboard Overview

The Sales Performance Dashboard was developed using Microsoft Power BI.

The dashboard includes the following components:

- Total Sales KPI
- Total Transactions KPI
- Unique Customers KPI
- Total Estimated Profit KPI
- Estimated Profit Margin KPI
- City-wise Sales Analysis
- Category-wise Sales Analysis
- Monthly Sales Trend
- Category-wise Estimated Profit Analysis
- Interactive City and Date slicers

5. Business Insights and Analysis

5.1 Insight 1 – City-wise Sales Performance

Observation:

Identify the highest and lowest sales-generating cities using the City-wise Sales Performance chart.

Business Interpretation:

The comparison helps understand the contribution of different geographical locations to overall sales performance.

Business Recommendation:

Focus on expanding marketing campaigns and maintaining product availability in high-performing cities. Investigate the reasons for lower sales in underperforming locations.

5.2 Insight 2 – Category-wise Sales Performance

Observation:

Identify the product category contributing the highest and lowest revenue.

Business Interpretation:

Category-wise sales analysis helps understand customer preferences and product demand.

Business Recommendation:

Maintain sufficient inventory for high-demand categories and introduce promotional offers to improve sales in lower-performing categories.

5.3 Insight 3 – Monthly Sales Trends

Observation:

Identify the months with the highest and lowest sales using the Monthly Sales Trend chart.

Business Interpretation:

Monthly sales trends help understand changes in customer demand and identify potential seasonal purchasing patterns.

Business Recommendation:

Plan inventory levels and marketing campaigns according to monthly demand. Introduce special promotions during lower-sales periods.

5.4 Insight 4 – Profitability Analysis

Observation:

Compare estimated profit across different product categories and identify the highest and lowest contributors.

Business Interpretation:

Estimated profitability analysis helps understand how different product categories contribute to the overall estimated profit.

Business Recommendation:

Prioritize categories with higher estimated profit contributions and review pricing and operating costs for categories with lower estimated profitability.

5.5 Insight 5 – Customer and Transaction Analysis

Observation:

Analyse total transactions, unique customers and average order value using the dashboard KPIs.

Business Interpretation:

These metrics help understand customer purchasing activity, transaction volume and average revenue generated per order.

Business Recommendation:

Introduce customer loyalty programmes, personalized promotions and product bundles to encourage repeat purchases and improve average order value.

6. Interactive Dashboard Analysis

City and Date slicers were used to analyse sales performance under different filtering conditions.

The dashboard was tested by selecting different cities and date ranges.

This helped understand how sales, customer activity, transactions and estimated profitability change according to the selected filters.

7. Key Findings

The dashboard provides a consolidated view of sales performance across different cities, product categories and time periods.

The analysis helps identify revenue contributions, customer purchasing patterns and estimated profitability.

These findings can support better inventory planning, marketing strategies and business decision-making.

8. Business Recommendations

Based on the dashboard analysis, the following recommendations were identified:

1. Improve marketing strategies in low-performing cities.
2. Focus on maintaining inventory for high-demand product categories.
3. Plan promotional campaigns based on monthly sales trends.
4. Monitor category-wise estimated profitability and review pricing strategies.

5. Improve customer retention through loyalty programmes and personalized offers.

9. Conclusion

Successfully analysed the Sales Performance Dashboard using Microsoft Power BI and identified five important business insights.

The exercise provided practical experience in interpreting KPIs, analysing sales trends, comparing category and city performance, evaluating estimated profitability and developing actionable business recommendations.

It demonstrated how data visualization and business storytelling can convert raw sales information into meaningful insights that support business decision-making.

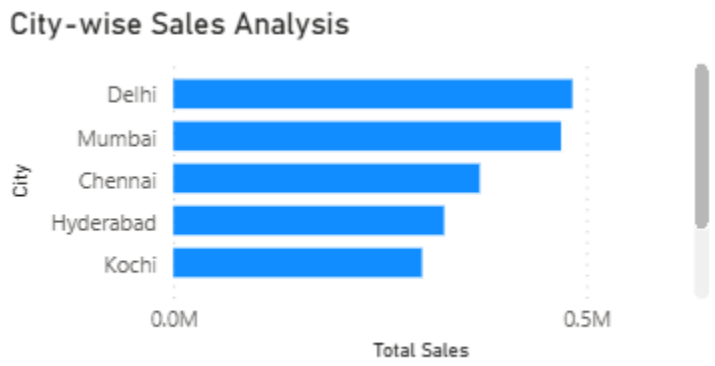

10. Screenshots and Evidence

Attach the following screenshots as evidence:

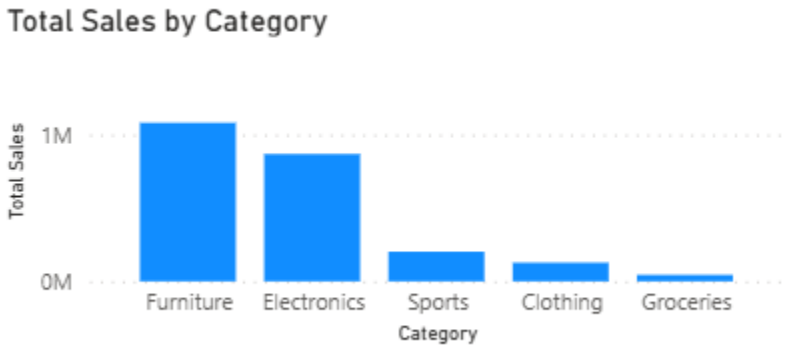

1. Complete Sales Performance Dashboard.

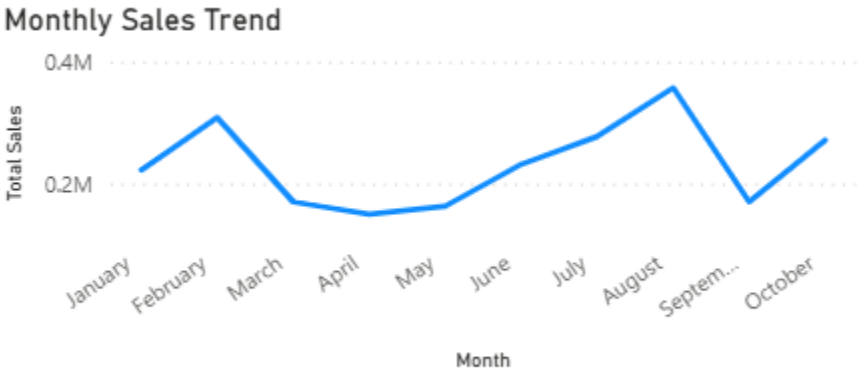

2. City-wise Sales Performance chart.

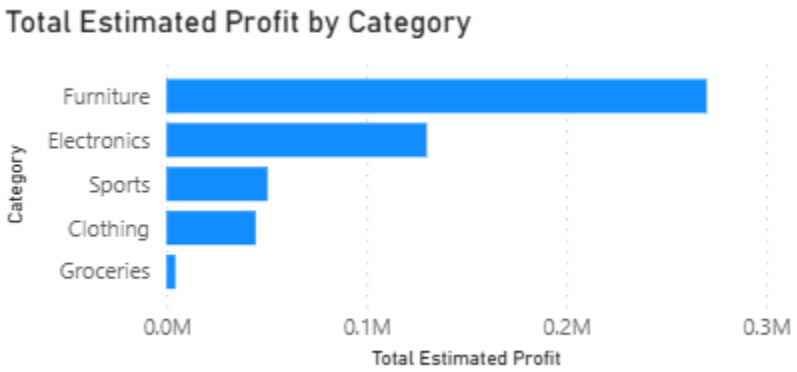

3. Category-wise Sales Performance chart.

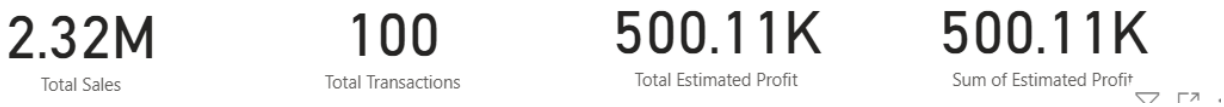

4. Monthly Sales Trend chart.

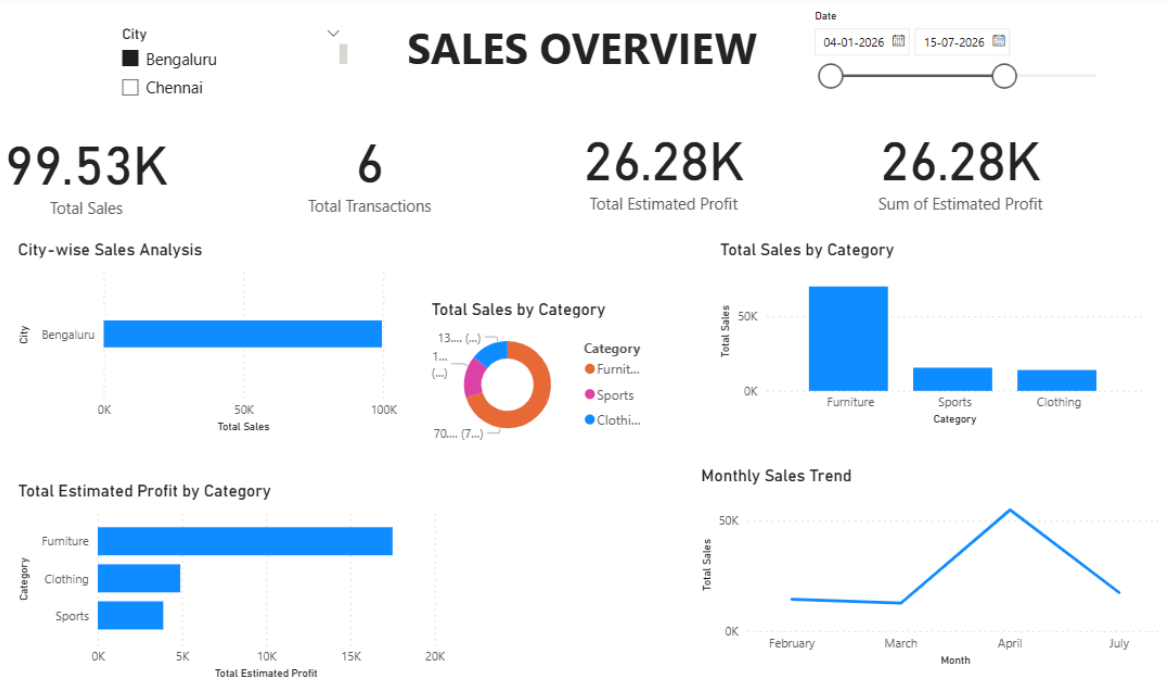

5. Category-wise Estimated Profit chart.

6. KPI cards showing sales, customers, transactions and profitability.

7. Dashboard with City and Date slicers applied.
